The present invention relates to 4(5)-substituted imidazole derivatives and their non-toxic salts, and their preparation and use.

- 5 The imidazole derivatives of this invention are new potent and selective  $\alpha_2$ -receptor antagonists of the formula:

10

15

wherein X is  $-\text{CH}_2-$ ,  $-\text{CH}_2\text{CH}_2-$  or  $-\text{O}-$ , R<sub>1</sub> is H, alkyl of 1 to 4 carbon atoms, alkenyl of 2 to 4 carbon atoms,  $\text{OCH}_3$  or  $\text{OCH}_2\text{CH}_3$ , R<sub>2</sub> is H,  $\text{CH}_3$ ,  $\text{CH}_2\text{CH}_3$ ,  $\text{OCH}_3$  or OH, R<sub>3</sub> is H,  $\text{CH}_3$ ,  $\text{CH}_2\text{CH}_3$ ,  $\text{OCH}_3$  or Hal, R<sub>4</sub> is H,  $\text{CH}_3$ ,  $\text{CH}_2\text{CH}_3$ ,  $\text{OCH}_3$  or Hal, and Hal is halogen, and their non-toxic

- 20 pharmaceutically acceptable acid addition salts.

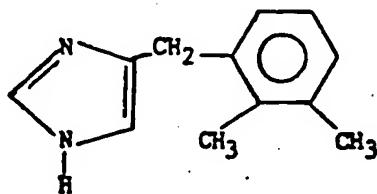

- The compounds of the formula (I) form acid addition salts with both organic and inorganic acids. They can thus form any pharmaceutically usable acid addition salts, as, for instance, chlorides, bromides, sulfates, nitrates, phosphates, sulfonates, formates, tartrates, maleates, citrates, benzoates, salicylates, ascorbates and the like.

The invention includes within its scope pharmaceutical compositions comprising at least one of the compounds of formula (1) or a non-toxic, pharmaceutically acceptable salt thereof, and a compatible pharmaceutically acceptable carrier therefor.

5 Adrenergic receptors are physiologically active binding sites which are specific to noradrenaline and adrenaline and located on the surface of the cell membrane. The adrenoceptors of the sympathetic nervous system have been classified into two different subtypes, namely alpha- ( $\alpha$ ) and beta-( $\beta$ ) receptors which can both be further 10 divided into two subgroups, i.e.  $\alpha_1$  and  $\alpha_2$  as well as  $\beta_1$  and  $\beta_2$ . Of these receptor types,  $\beta_1$ ,  $\beta_2$  and  $\alpha_1$ , are mainly located postsynaptically on the surface of, e.g., smooth muscles and thus mediate, e.g., smooth muscle contraction or relaxation; whereas  $\alpha_2$  receptors are mainly located presynaptically on the terminals of noradrenergic nerves. If  $\alpha_2$  receptors 15 are stimulated by noradrenaline under physiological conditions, noradrenaline release is blocked, i.e. there is a negative feed-back phenomenon.

As well as by noradrenaline itself, this negative feed-back phenomenon may be induced by certain synthetic  $\alpha_2$ -agonists like 20 detomidine (compound A) and some of its near derivatives. The primary pharmacodynamic effects of detomidine, e.g. sedation, have also been proved to be due to its ability to stimulate  $\alpha_2$ -receptors (Virtanen et al., Progress in Neuro-Psychopharmacology and Biological Psychiatry, suppl. 1983, p.308).

25 The compounds of formula (1) have valuable properties as antagonists to sedatives and analgetics used in veterinary medicine. Such veterinary medicines include, e.g., detomidine (compound A) and near derivatives thereof.

Compound A  
(detomidine)

Compound A has been disclosed in e.g. Eur. Pat. Appl. 24829.

Detomidine is used in veterinary medicine, especially in the handling of horses and cattle (pharmacological restraint), whereby  
5 the animal is sedated before investigation, treatment and difficult medical operations. Even a small surgical operation cannot be carried out without the use of a sedative agent.

When the treatment using detomidine has been completed, it  
10 is for practical reasons desirable to interrupt and restrain its effect by a specific antagonist or antidote. The animal can then immediately be transported away from the surgery, and expensive awakening rooms are not required. The ability of the animal to control its movements and co-ordination after awakening is improved.  
15 When animals are treated in cold surroundings this is absolutely necessary, because otherwise the animal will remain lying still for too long a time. When an awakening agent is used, the feeding of cattle can start more rapidly than otherwise. An interruption in feeding causes disturbances in production.

20

The use of an awakening agent in association with the use of detomidine saves time for the veterinarian as well as for the owner of the animal. The antidote makes practical the use of higher doses of detomidine, which induce a stronger analgetic effect. Thus,  
25 the safety of the treatment of big animals is increased. Without any awakening agent, detomidine cannot be used in some cases, as it is often not possible to wait until the animal has recovered from the influence of detomidine.

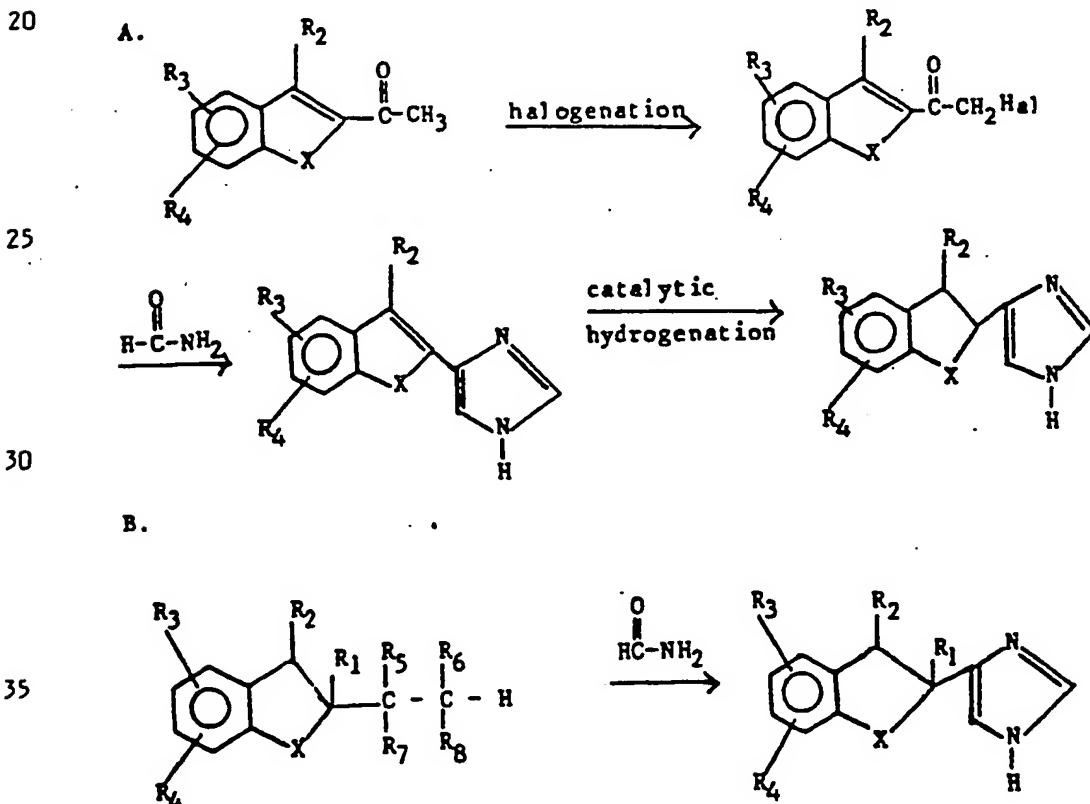

30 A selective  $\alpha_2$ -antagonist may also be predicted to be of use in some diseases which are believed to be connected with deficiency of noradrenalin available in the postsynaptic adrenoceptors of the central and/or peripheral nervous system. These diseases include, e.g., endogenic depression and asthma.

Glucose and lipid metabolisms are regulated by an inhibitory mechanism involving  $\alpha_2$ -receptors. Thus  $\alpha_2$ -antagonists may be significant in the treatment of metabolic diseases like diabetes and obesity.

5

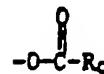

Presynaptic  $\alpha_2$ -receptors also take part in platelet aggregation. It has been shown that  $\alpha_2$ -agonists activate and antagonists inhibit human platelet aggregation (Grand & Schutter, Nature 1979, 277, 659). Thus  $\alpha_2$ -antagonists may be useful clinically in pathogenic states involving increasing aggregation, e.g. migraine. The acute effects of ergotamine, a classical compound against migraine, are regarded as being due to its  $\alpha_1$ -agonist effect. Thus compounds with both antagonist effects of  $\alpha_2$ -receptors and agonist effects of postsynaptic  $\alpha_1$ -receptors may have great advantages in the acute and preventive treatment of migraine.

The compounds of the formula (I) can be prepared by the following processes:

- 5 -

wherein each of  $R_5$ ,  $R_6$ ,  $R_7$  and  $R_8$  is hydrogen, hydroxy, halogen, amino, -O-alkyl containing 1 to 7 carbon atoms, or

25 In process B1 the first and second steps are performed in the same way as the corresponding steps in process A.

Process B2. The Grignard reaction is carried out in an ether, e.g. tetra-hydrofuran or diethyl ether, at room temperature.

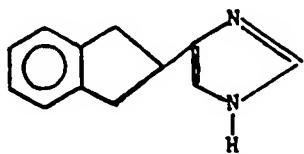

30

The reduction step is performed with e.g. sodium borohydride in ethanol at room temperature. The reaction with formamide is carried out as in A and B1, namely by heating at 130-200°C for 3-8 hours.

5 Process C. The halogenation is carried out with e.g. bromine in acidified water at about 10°C.

The pharmacological activity of the compounds of the present invention was determined as follows:

1.  $\alpha_2$ -antagonism in vitro

$\alpha_2$ -antagonism was determined by means of isolated, electrically stimulated mouse vas deferens preparation (Marshall et al., Br. J. Pharmac. 62, 147, 151, 1978). In this model,  $\alpha_2$ -agonist (detomidine) blocks electrically stimulated muscular contractions and the effect of the  $\alpha_2$ -antagonist is seen by administering it prior to the agonist and by determining its  $pA_2$  value. Known  $\alpha_2$ -antagonists like yohimbine and rauwolscine were used as reference substances.

To obtain information also on the selectivity of the antagonist between  $\alpha_1$ - and  $\alpha_2$ -receptors, its ability to inhibit or stimulate  $\alpha_1$ -receptors was determined by means of isolated anococcygeus muscle (rat). The reference substances were now phenylephrine, a known  $\alpha_1$ -agonist, and prazosin, a known  $\alpha_1$ -antagonist. To determine  $\alpha$ -antagonism, muscular contraction was induced by phenylephrine and the  $pA_2$  value of the studied compound was determined as above.  $\alpha_1$ -agonist effect is presented as the  $pD_2$  value (negative logarithm of the molar concentration of the compound producing 50 per cent of maximal contraction). Examples of the results are given in Table 1.

2.  $\alpha_2$ -antagonism in vivo

The central  $\alpha_2$ -blocking effect of the studied substances under in vivo conditions was studied using two methods. First, it is known that in the rat  $\alpha_2$ -agonists induce dilatation of the pupil (mydriasis) which effect is transmitted via  $\alpha_2$ -receptors of the central nervous system. In anaesthetized rat, a standard dose of detomidine was administered intravenously. Thereafter increasing doses of the studied antagonist were injected intravenously and the reversal of detomidine-induced mydriasis was followed. The ED<sub>50</sub> value of the antagonist, i.e. the dose producing a 50 per cent reversal, was determined. Examples of the results of this test are presented in Table 2.

$\alpha_2$ -antagonism in the central nervous system was secondly studied by following the ability of the antagonist to inhibit 20 detomidine induced sedation in the mouse. This was done by measuring the increase of barbiturate sleeping time induced by detomidine. This effect of detomidine is known to be induced through  $\alpha_2$ -receptor activation. The antagonist can be studied by administering it prior to detomidine. The results of the 25 selected compounds are shown in Table 3.

In the examples below, where  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectrum shifts are presented, the NMR spectra were determined with a Bruker WB 80 DS apparatus using an internal tetramethylsilane standard, from which the presented chemical shifts ( $\delta$ , ppm) are tabulated. The letters s, d, t and m are used to indicate a singlet, doublet, triplet or multiplet, respectively. In the same connection, the number of hydrogen atoms is also stated. The compounds which are indicated as bases are tested in deuterium methanol, deuterium-acetone or deuterium chloroform, while the values for compounds which are indicated as hydrochlorides were determined in deuterium oxide or deuterium methanol. The mass spectra were determined with a Kratos MS 80 Autoconsole apparatus.

Example 1

4(5)-(2,3-Dihydro-1H-inden-2-yl)imidazole

15 The 1-(2,3-dihydro-1H-inden-2-yl)ethanone used as the starting material can be obtained according to the publication (Carlson, G. L. B., Quina, F. H., Zarnegar, B. M. and Whitten, D. G., J. Am. Chem. Soc. 97 (1975) 347).

a) 2-Bromo-1-(2,3-dihydro-1H-inden-2-yl)ethanone

20 Bromine (6.8 g) is slowly added to a stirred solution of 1-(2,3-dihydro-1H-inden-2-yl)ethanone (6.8 g) in 200 ml of dry ether, while keeping the temperature at + 10°C. The rate of the addition of bromine is controlled so that the colour due to one added portion of bromine has been discharged before another portion is added. When the addition is complete, the ethereal solution is washed four times with 3 M sodium carbonate solution, and is then washed three times with water. The ethereal solution is dried with anhydrous magnesium sulphate. After removal of the solvent the solid 2-bromo-1-(2,3-dihydro-1H-inden-2-yl)ethanone is obtained.

## b) 4(5)-(2,3-Dihydro-1H-inden-2-yl)imidazole

A mixture of 2-bromo-1-(2,3-dihydro-1H-inden-2-yl)ethanone (9.4 g) and formamide (140 ml) is heated at 170-180°C for 4 hours. Then the reaction mixture is allowed to cool to ambient temperature and poured into ice-cold, dilute hydrochloric acid solution. The mixture is washed twice with toluene. Then the aqueous layer is made alkaline with ammonia and extracted several times with ethyl acetate. The combined organic layers are dried over anhydrous magnesium sulfate and evaporated to dryness under reduced pressure. The oily residue, which contains the crude product of 4(5)-(2,3-dihydro-1H-inden-2-yl)imidazole is purified by flash chromatography (solvent system: methylene chloride - methanol 9.5:0.5). The 4(5)-(2,3-dihydro-1H-inden-2-yl)imidazole thus obtained is converted to its hydrochloride salt. The base is dissolved in ethyl acetate. Dry hydrogen chloride in ethyl acetate is added. The hydrochloride is precipitated with dry ether.

 5 solution of cis-1-(2,3-dihydro-1-methyl-1H-inden-2-yl)ethanone  
 (34.8 g) in methylene chloride (835 ml), while keeping the  
 temperature at + 10°C. The reaction is followed by GLC. The  
 first products are the isomers of 1-(2-bromo-2,3-dihydro-1-  
 10 methyl-1H-inden-2-yl)ethanone and cis-2-bromo-1-(2,3-dihydro-1-  
 methyl-1H-inden-2-yl)ethanone. When the added amount of bromine  
 is about 0.3 mol, only the final product, 2-bromo-1-(2-bromo-  
 15 2,3-dihydro-1-methyl-1H-inden-2-yl)ethanone is visible in the  
 chromatogram and the mono bromo products cannot be seen in the  
 chromatogram any more. The methylene chloride solution is washed  
 with water, then several times with the diluted NaHCO<sub>3</sub> solution  
 and finally with water. The solvent is dried with Na<sub>2</sub>SO<sub>4</sub> and  
 evaporated to dryness.

## Example 13

## 4(5)-(2,3-Dihydro-1H-inden-2-yl)imidazole

## a) 2,3-Dihydro-1H-inden-2-yl glyoxal diethyl acetal

5 0.73 g of magnesium turnings are covered with 90 ml of dry diethylether. To that mixture is then added 6 g of 2-bromoindane in 20 ml of dry diethylether at such a rate that a gentle boiling is maintained. When the magnesium turnings have reacted the solution containing the Grignard reagent is cooled to room 10 temperature. The reaction mixture is then added dropwise, over a period of 3 hours, to a cooled (0 - 5 °C) solution of diethoxy-acetic acid piperidinyl amide (6.4 g) in 20 ml of dry diethylether. After the addition is complete, the reaction mixture is stirred for two hours at about 5 °C. The mixture is then poured 15 into a cold 2 % sulfuric acid solution (50 ml). The solution is extracted with ether and the combined ether extracts are washed with water and evaporated to dryness to give a residue of crude product, which is used without purification in step b).

## 20 b) 1,1-Diethoxy-2-hydroxy-2-(2,3-dihydro-1H-inden-2-yl)ethane

4 g of crude 2,3-dihydro-1H-inden-2-yl glyoxal diethyl acetal is dissolved in 20 ml of ethanol and 3.8 g of sodium borohydride is added in small portions at a temperature below 30 °C. After the 25 addition is complete, the mixture is stirred overnight at room temperature. About 15 ml of ethanol is distilled off and 30 ml of water is added. The solution is extracted with methylene chloride. The combined methyle chloride extracts are washed with water, dried with sodium sulfate, and evaporated to dryness. The 30 yield is about 4 g of oil, which is used directly in step c).

## c) 4(5)-(2,3-Dihydro-1H-inden-2-yl)imidazole

4 g of the oil from the preceding step and 15 ml of formamide are combined and stirred at 150 °C while passing ammonia gas into the solution for 6 hours. The mixture is cooled to room temperature and 40 ml of water is added. Concentrated hydrochloric acid is added with cooling until the pH is 3-4.

The solution is washed with toluene, cooled and the pH is adjusted to 10 - 12 with 20 % sodium hydroxide solution. The mixture is extracted with methylene chloride and the combined methylene chloride extracts are extracted with 10 % acetic acid solution. The combined acetic acid extracts are made alkaline (pH 10 - 12) with 20 % sodium hydroxide solution. The product is extracted into chloroform, and the combined chloroform extracts washed with water and dried with sodium sulfate. The solution is evaporated to dryness to give the product as base.

The hydrochloride is prepared by dissolving the base in ethyl acetate and adding HCl-ethyl acetate until pH is about 4. The mixture is cooled and filtered and the filter cake washed with a small amount of ethyl acetate. M.p. 185 - 193 °C.
